

Forklift Attachment

Forklift Attachments Northwest Territories - Without forklift attachments, many jobs would be difficult, if not impossible. There are numerous forklift attachments that make jobs faster and safer to complete. Forklift operators require training for each attachment they will be using as well as their general forklift training. There are many non-hydraulic attachments and hydraulic attachments available for forklift attachments. They provide many benefits including decreasing fuel consumption, time, man-power, damage to stock and employee accidents. Equipment Considerations A forklift attachment can replace an existing forklift attachment or can be added to a forklift that does not already have one. Various considerations need to be taken prior to adding or replacing any forklift attachment. These considerations include the kind of forklift, the machine's capacity, the number of hydraulic functions required to power the attachment's and the type of carriage. Failing to take these aforementioned factors into consideration can create extra safety hazards and risks for the operator, the forklift, its' attachments and the stock. Further safety factors must also be taken into consideration, which will be discussed in greater detail below. Forklift Rating and Re-Rating Manufacturers give forklifts a lift capacity rating that needs to be considered and adjusted when adding or changing forklift attachments. Online calculators are available from manufacturers of forklift attachment's to provide estimates on every attachments' lifting capacity. It is important to note that only the forklift manufacturer can provide accurate lifting capacities. Before installing any kind of attachment, it is essential to contact the local authorized forklift dealer of the particular forklift brand to request that they rate the machine accordingly with the attachment being used. After the manufacturer of the forklift has re-rated the forklift, it should have a new factory authorized specification plate. The upgraded specification plate replaces the original plate and needs to be installed with the new forklift rating showing. Equipment Upgrades Forklift attachments rely on the machine's hydraulic function and are made up of a forklift valve that has a lever situated close to the operator. This creates two passages of pressurized hydraulic oil for powering the attachment features. While not all forklift attachments are hydraulic, hydraulic attachments often include more features than the forklift has valves. In this circumstance, it is common to add one or more valves as needed. There are numerous ways a valve can be added. The manufacturers of forklifts create accessories to simplify hose and valve routing. However, the parts and labor to install these can be so expensive as to make this option impractical. Alternative methods include adding a solenoid valve in conjunction with a hose or cable reel that diverts oil flow from an existing function. The main issue is that the cable reels and hose may block the view of the operator and these items can be damaged. Kits are available that rely on a solenoid valve and certain hoses to transform the reinforced braid to additionally function as an electrical conduit. Because these hoses replace the existing hoses housed in the forklift, the hoses are safe from damage while keeping the operator's field of vision clear. Safety Considerations Prior to fitting any type of forklift attachment, proper training must be obtained. The operator needs to be able to remove, fit and operate the attachment. Two important safety factors must be considered before the use of any forklift attachment. First, any attachment on a forklift will reduce its nominal load rating, as mentioned above. Forks and a stock fork carriage compute the nominal load rating; although, the precise load rating may be much lower. Secondly, the forklift's center of gravity will be affected when any forklift attachment is added. This will reduce the forklift's stability. Since the attachment's weight is prominent in front of the fulcrum point on the forklift, the operator needs to drive the machine as though it is partially loaded even before it is carrying a load. Thus, when using any attachment, an operator should travel at a slow speed and make turns slowly and gently. As noted above, each attachment should be listed on the data plate of the forklift's capacity. Certain safety checks need to be done before using any kind of attachment. The forklift attachment must be permitted on the forklift's data plate, locked properly, correctly attached, appropriate for the particular load and appropriate for the type of forklift being used. List of Common Forklift Attachments Below is a list of popular forklift

attachments and their general uses. This is just a sample list of some of the most popular forklift attachments. As you will see, the large variety of attachments available have the capacity to greatly increase the efficiency of many jobs. **SIDESHIFTER:** Allows the operator to move the forks laterally, allowing for easier placement of a load without the need to reposition the entire forklift. **FORK POSITIONERS:** Moves the forks together or apart in relation to one another to adjust for various load types. **DIMENSIONING DEVICES:** Provide dimensions for the cargo allowing for more efficient use of warehouse and truck trailer space and often used in conjunction with billing systems based on volume. **ROTATOR:** Rotators help to right tilted skids and are useful for fast unloading and tackling custom load requirements. Many attachments include a rotator feature. **ROLL AND BARREL CLAMP:** The roll and barrel clamp simplifies grasping rounded loads such as barrels. It has numerous pressure settings for handling fragile items with less damage potential. This attachment often has a rotate function to change the load from a vertical to a horizontal position. **CARTON AND MULTIPURPOSE CLAMP:** Allows for grasping a load with a more squared shape, often with pressure settings. Products like cartons, boxes and bales can be moved with this type of attachment. **POLE ATTACHMENTS:** Pole attachments are placed where the forks would normally be and are used for transporting carpet and rolled up linoleum. **SLIP SHEETER OR PUSH-PULL:** The slip sheeter or push-pull allows the operator to move sheets by clamping onto slip sheets. This is an option instead of relying on pallets. The slip sheet can be moved onto thin and wide metal forks to simplify loading or unloading by pushing the slip sheet. The "Save" variation allows the slip sheet to be taken off for reuse later. The "Standard," attachment variation is another option. **DRUM HANDLER:** Allows for grasping drums, either with a spring-loaded jaw to grip the top lip of a drum, or with arms that encircle the drum, for transport. **DRUM AND STORAGE BIN TIPPER:** The drum and storage bin tipper is designed for easier transport of liquid items or loose materials into bigger containers. **MAN BASKET:** The lift platform known as a man basket is designed to transport workers vertically. It is outfitted with brackets and railings to anchor safety harnesses. **TELESCOPIC FORKS:** The telescopic forks are used in locations with a two pallet stacking design where one shelf is placed right behind another with no aisle between them. **SCALES:** Scales allow forklift operators to weigh their pallets during transport. This increases efficiency by providing simultaneous data and not making the operator travel back and forth to scales. This attachment can be used for operators who bill by weight in legal-for-trade applications. **SINGLE-DOUBLE FORKS:** Allow movement of a single pallet or platform or two pallets side by side. With the correct attachment/s a single forklift can be used for multiple specialist materials handling tasks alongside normal lifting tasks, thus reducing the need for owning a specialist unit alongside a normal unit and the larger running and maintenance costs associated with multiple units. **SNOW PLOW:** Snow plows are used to remove snow and redistribute it; however, this attachment can be used with other loose kinds of material. **SKIPS:** Skips facilitate fast and safe removal of waste to the proper waste or skip compactor. Skips are either a bottom-emptying model or a roll-forward type. **BOOMS AND JIBS:** Booms and jibs allow forklifts extended reach. They are available to transport deep or highly stacked loads, suspended loads and more. These attachments can be low profile, precision lifting or reach over models to facilitate extended lengths.
